(54) Title: **SURGICAL IMPLANT SYSTEM FOR TREATING FEMALE URINARY INCONTINENCE**

(57) Abstract: A surgical implant system for treating female urinary incontinence has at least one suspending device (10, 10') and a support structure (100) for the urethra (182). The suspending device has an upper end area and a lower end area, the upper end area being able to be fastened on an internal anatomical tissue structure (180) to the side of and above the urethra. The support structure is designed for implantation transversely with respect to the urethra and has a fastening device (104, 105) which is assigned to the suspending device and which fastens the support structure to the suspending device. The fastening device is arranged to the side of the urethra and, after it has been removably fastened on the suspending device, it can be moved along the suspending device in order to adjust the position of the support structure.
